54 Rare earth-containing high-silica zeolite having penta-sil structure and process for the same.

57 The present invention discloses a rare earth- containing high- silica zeolite having penta-sil type structure and process for the same. The anhydrous composition of the high-silica zeolite of the present invention (based on the mole ratio of oxides) can be defined by the formula

in which $X=0.01-0.30$, $y=0.4-1.0$, and $z=20-60$. The high-silica zeolite of the present invention is an useful active component for catalysts.

Field of the Invention

The present invention relates to a crystalline aluminosilicate zeolite and process for the same, especially relates to a rare earth-containing high-silica zeolite having penta-sil structure and process for the same and also the application of the high-silica zeolite in hydrocarbon conversion.

Background of the Invention

Zeolite ZSM-5 developed by Mobil Oil Corporation (USP 3,702, 886) is a penta-sil type high-silica zeolite having a pore dimension of 0.54 - 0.56 nm and a framework silica alumina ratio above 12. Based on the unique pore structure of the zeolite, it can be applied extensively as a catalytic material to various processes such as isomerization, disproportionation, catalytic cracking, catalytic dewaxing etc. However, its property is not satisfying in some applications. For example, when the zeolite is used in catalytic cracking of petroleum, the enhancement of gasoline octane is accompanied by the unavoidable obvious decrease of gasoline yield (J. Oil & Gas, May 13, 1985, P. 108). When it is used as an active component of a catalyst, the remarkable framework dealumination occurs during the hydrothermal regeneration of the catalyst may cause significant loss of catalyst activity and shape selectivity (USP 4, 490, 241).

Conventionally, the adsorptive and catalytic properties of a zeolite can be modified through ion-exchange. For example, CaA zeolite obtained by the ion-exchange of NaA zeolite with Ca^{++} possesses excellent ability for separating normal paraffin from iso-paraffin, hence can be used in the dewaxing process in petroleum refining (USP 3, 201,409). REY zeolite obtained by the ion-exchange of NaY zeolite with RE^{3+} exhibits higher activity and stability than that of NaY, hence becomes the most widely-used active component in catalytic cracking catalysts for decades (USP 3,402,976). In the case of ZSM-5 zeolite, the lower charge density within the pore channel as a consequence of the higher silica alumina ratio, the stronger hydrophobicity, and the smaller pore opening (0.54 - 0.56 nm), make it difficult to introduce trivalent state cation such as RE^{3+} into the intra-crystalline structure (P. Cho and F. G. Dwyer, ACS, Symp. Ser., 218, 59 - 78, 1983).

Objects of the Invention

One object of the present invention is to provide a rare earth-containing penta-sil type high-silica zeolite having narrower pore-opening for overcoming the shortcomings of the prior arts. The framework composition of the catalyst containing the zeolite of the present invention as an active component is more stable during the hydrothermal regeneration process.

Another object of the present invention is to provide a process for synthesizing said high-silica zeolite.

A further object of the present invention is to provide catalysts containing the zeolite of the present invention as active component.

Summary of the Invention

The rare earth-containing penta-sil type high-silica zeolite of the present invention is a crystalline aluminosilicate high-silica zeolite having an anhydrous chemical composition of the formula (based on the mole ratios of oxides):

wherein $x = 0.01 - 0.30$, $y = 0.4 - 1.0$, $z = 20 - 60$. Said zeolite possesses X-ray diffraction pattern listed in Table 1, narrower pore opening than that of ZSM-5 zeolite, and 2 - 4 times higher normal hexane/cyclohexane adsorption ratio than that of ZSM-5 zeolite.

The high-silica zeolite of the present invention is synthesized by using rare earth-containing faujasite as seed in a gel system composed of water glass, aluminium salt, inorganic acid, and water.

The high-silica zeolite of the present invention can be used as catalysts for hydrocarbon conversion in a variety of catalytic conversion processes in the field of hydrocarbon processing and petrochemical processes.

Detailed Description of the Invention

The present invention provides a rare earth- containing penta- sil type crystalline aluminosilicate high-silica zeolite having an anhydrous chemical composition (based on the mole ratios of oxides) of formula:

wherein $X = 0.01 - 0.30$, $y = 0.4 - 1.0$, $z = 20 - 60$.

It possesses a X-ray diffraction pattern listed in Table 1 and 2 - 4 times higher normal hexane/cyclohexane adsorption ratio than that of ZSM-5 zeolite.

The rare earth elements contained in the high-silica zeolite of the present invention originate from the rare earth- containing seeds used for synthesis. The composition of said zeolite is formed through the reaction of rare earth-containing faujasite seeds with the gel system composing of water glass, aluminium salt, inorganic acid, and water. Said rare earth-containing faujasite seed is REY, REHY, or REX, which contains 2 - 27 wt. % rare earth elements and < 7.0 wt. % sodium (both based on the weight of oxide).

The high-silica zeolite of the present invention having above-mentioned anhydrous composition can be converted to H-type high- silica zeolite through ammonium-exchange and calcination, which possesses a X - ray diffraction pattern listed also in Table 1.

Table 2 is a comparison of X - ray diffraction patterns between the high-silica zeolite and H- type of said high- silica zeolite of the present invention and ZSM-5 and H-ZSM-5 zeolite of U. K. Patent No. 1, 161, 974.

Table 2 indicates that, the line intensities of the XRD pattern of the high-silica zeolite of the present invention are evidently different from that of ZSM-5 zeolite, and some new lines appear in the XRD pattern of the zeolite of the present invention, which do not exist in the XRD pattern of ZSM-5 zeolite. The chemical composition of the high-silica zeolite of the present invention is characterized in containing intra-crystalline trivalent rare earth cations. The pore opening of the zeolite of the present invention is narrower than that of ZSM-5 zeolite, and normal hexane/cyclohexane adsorption ratio on the zeolite of the present invention is higher than that on ZSM-5 zeolite. Table 3 is the comparison of normal hexane/cyclohexane adsorption ratio between the high-silica zeolite of the present invention and ZSM-5 zeolite.

Table 3

5	Example	Adsorption Capacity, mg/g n-hexane* cyclohexane	n-hexane absorbed/cyclo- hexane absorbed
10	8	100.8	14.8
	9	103.5	14.2
	10	104.2	15.1
	11	102.9	13.9
15	12	105.1	15.6
	13	101.7	14.6
	14	102.5	15.0
20	HZSM-5	112.0	52.2

* The kinetic diameter of n-hexane is 0.43 nm.

** The kinetic diameter of cyclohexane is 0.61 nm.

As shown in Table 3, the normal hexane/cyclohexane adsorption ratios on the high-silica zeolite of the present invention is higher than that on ZSM-5 zeolite.

The performance characteristics of the high-silica zeolite of the present invention, such as better hydrothermal stability and catalytic activity compared to ZSM-5 zeolite, will be further described hereinafter.

The present invention also provides a process for synthesizing said high-silica zeolite, comprising dispersing homogeneously the rare earth-containing faujasite seeds into a gel system composing of water, glass, aluminium salt, inorganic acid, and water, crystallizing at 130 - 200 °C, preferably at 160 - 190 °C, for 12 - 60 hours, preferably for 16 - 30 hours, filtrating, washing, and finally drying.

The mole composition of said gel system is as follows:

SiO₂/Al₂O₃ = 30 - 120
Na₂O/Al₂O₃ = 2 - 15
H₂O/SiO₂ = 20 - 100

Said crystallization seed is REY, REHY, or REX, which contains rare earth elements 2 - 27% and sodium < 7.0% (both based on the weight of oxides). The amount of the seed used should satisfy the mole ratio of RE₂O₃ (from seed) and Al₂O₃ (in said gel system) being in the range of 0.01 - 0.40.

Said aluminium salt is Al₂(SO₄)₃, AlCl₃, and aluminium salts of phosphoric acid such as AlPO₄, Al₂(HPO₄)₃, or Al(H₂PO₄)₃, preferably AlPO₄, most preferably AlPO₄ gel. AlPO₄ gel can be prepared as follows:

Pseudo-boehmite and aqueous phosphoric acid solution are mixed together homogeneously according to the weight ratio Al₂O₃ : H₃PO₄ : H₂O = 1 : 1.5 - 3.0 : 5 - 15, followed by ageing in still state at ambient temperature for more than 4 hours, preferably for more than 24 hours, to prepare AlPO₄ gel.

Said inorganic acid is phosphoric acid, sulfuric acid, hydrochloric acid, or nitric acid. The amount of the inorganic acid used should make the PH value of the system in the range of 10 - 12.

The preparation of the rare earth-containing faujasite used as seed in the present invention is as follows:

REY zeolite seed

NaY zeolite is exchanged with RECl_3 solution according to the weight ratio of zeolite (dry base): $\text{RECl}_3 : \text{H}_2\text{O} = 1 : 0.01 - 11.0 : 10 - 100$, preferably $1 : 0.1 - 0.5 : 20 - 80$, for 2.0 hours, followed by filtrating and
 5 calcining in flowing dry air or 100% steam at $400 - 600^\circ\text{C}$ for 0.5 - 4.0 hours. The calcined zeolite may undergo above- mentioned exchange-calcination procedure for one more time.

REHY zeolite seed

10 NaY zeolite is exchanged with aqueous $(\text{NH}_4)_2\text{SO}_4$ solution according to the weight ratio of zeolite (dry base): $(\text{NH}_4)_2\text{SO}_4 : \text{H}_2\text{O} = 1 : 0.2 - 4.0 : 10 - 40$, preferably $1 : 0.8 - 2.0 : 20 - 30$, at $50 - 150^\circ\text{C}$, preferably $80 - 120^\circ\text{C}$, for 0.2 - 20 hours, followed by filtrating. Said procedure of exchange and filtration can be repeated 1 - 2 times. The filter cake is calcined in flowing dry air at $400 - 600^\circ\text{C}$ for 0.5 - 4.0 hours. The calcined zeolite is exchanged with RECl_3 solution according to the weight ratio of zeolite(dry base) : $\text{RECl}_3 :$
 15 $\text{H}_2\text{O} = 1 : 0.05 - 1.0 : 10 - 100$, preferably $1 : 0.2 - 0.8 : 20 - 50$, at $50 - 150^\circ\text{C}$, preferably $80 - 120^\circ\text{C}$, for 0.2 - 2.0 hours. After filtration, the filter cake may be calcined in flowing dry air at $400 - 600^\circ\text{C}$ for 0.5 - 4.0 hours, or may not be calcined.

REX zeolite seed

20 NaX zeolite is exchanged with RECl_3 solution according to the weight ratio of zeolite (dry base): $\text{RECl}_3 : \text{H}_2\text{O} = 1 : 0.01 - 1.0 : 10 - 100$, preferably $1 : 0.1 - 1.0 : 10 - 100$, preferably $1 : 0.1 - 0.6 : 20 - 60$, at $50 - 150^\circ\text{C}$, preferably at $60 - 120^\circ\text{C}$, for 0.2 - 2.0 hours. After filtration, the filter cake is calcined in flowing dry air or 100% steam at $400 - 550^\circ\text{C}$ for 0.5 - 4.0 hours. The above- mentioned exchange-calcination
 25 procedure may be repeated for the calcined zeolite.

As mentioned above, the high-silica zeolite of the preset invention contains rare earth elements, possesses penta-sil type structure, has narrower pore opening, better activity- stability for hydrothermal treatment, and better shape selectivity, compared with ZSM- 5 zeolite. After conventional NH_4^+ exchange and Na^+ washing-off, the high- silica zeolite of the present invention can be incorporated with other active
 30 components and /or matrix components such as SiO_2 , Al_2O_3 , $\text{SiO}_2 - \text{Al}_2\text{O}_3$, and clays, to formulate catalysts used in various catalytic conversion processes including hydrocarbon processing and petrochemical production, such as catalytic cracking, deep catalytic cracking, catalytic dewaxing, hydrocracking, hydroisomerization, and so forth.

The present invention will be further described with reference to the following examples. However, these
 35 examples are not to be construed to limit the scope of the present invention.

Example 1

100 g (dry base) NaY zeolite having silica/alumina mole ratio of 5.0 (the $\text{SiO}_2/\text{Al}_2\text{O}_3$ mole ratio was
 40 determined by X - ray diffraction in all examples) as dispersed in 2100g 1.5 wt. % RECl_3 (containing 49 wt. % Ce_2O_3 and 24 wt. % La_2O_3) solution. The ion-exchange proceeded at 90°C for 30 minutes with stirring. After filtration the filter cake was calcined in flowing dry air at 550°C for 2 hours. The above-mentioned exchange- calcination procedure was repeated once more. The REY seed thus obtained had a chemical composition (wt. %) as follows:

45 RE_2O_3 18.2, Na_2O 1.5, Al_2O_3 19. 5, and SiO_2 60.7.

The Na_2O content was determined by atomic absorption spectroscopy, while the other components
 50 were determined by X - ray fluorescence spectroscopy.

60g (dry base) pseudo-boehmite was dispersed while stirring homogeneously in 375 g 30 wt. % aqueous H_3PO_4 solution. After keeping in still state for 24 hours at ambient temperature, the AlPO_4 gel containing 13.5 wt. % Al_2O_3 was obtained, which could be diluted to any concentration when in use.

2.8g above-prepared REY seed was dispersed in 200g water glass containing 3.5 wt. % Na_2O and 11.1
 55 wt. % SiO_2 . 54.9g AlPO_4 gel containing 1.1 wt. % Al_2O_3 was added to the above mixture while stirring. A 25 wt. % H_2SO_4 solution was used to adjust the PH of the above system making it into a gel state. The mole composition of the prepared gel was: $0.26\text{RE}_2\text{O}_3$ $8.9\text{Na}_2\text{O}$ Al_2O_3 60.0SiO_2 $0.98\text{P}_2\text{O}_5$ $2220\text{H}_2\text{O}$ (Al_2O_3 from seed was not included in the calculation, same for other examples). The prepared gel was crystallized

at 180 °C for 22 hours. After cooling and filtrating, the filter cake was washed with water to a neutral PH value, followed by drying at 110 - 120 °C . The obtained high-silica zeolite thereof had an anhydrous chemical composition(based on the mole ratio of oxides, same for other examples) as follows:

5 0.9Na₂O 0.13RE₂O₃ Al₂O₃ 31.2SiO₂

and had a SiO₂/Al₂O₃ mole ratio of 31.2.

Example 2

10 0.5g REY zeolite seed prepared in Example 1 was dispersed in 180 g water glass containing 3.8 wt. % Na₂O, and 11.0 wt. % SiO₂. 38.3 g AlPO₄ gel containing 1.1 wt. % Al₂O₃ was added to the mixture while stirring. A 11.0 wt. % H₃PO₄ solution was used to adjust the PH value of the system making a gel. The mole composition of the prepared gel was:

15 0.07RE₂O₃ 4.05Na₂O Al₂O₃ 80.0SiO₂ 7.6P₂O 3142H₂O.

The prepared gel was crystallized at 190 °C for 16 hours, followed by filtrating, washing, and drying as described in Example 1. The obtained high-silica zeolite thereof had an anhydrous chemical composition as follows:

20 0.95Na₂O 0.03RE₂O₃ Al₂O₃ 52.0SiO₂

and had a SiO₂/Al₂O₃ mole ratio of 52.0.

Example 3

REY zeolite seed was prepared according to the method described in Example 1 except that 100 g NaY zeolite having a silica/alumina mole ratio of 4.2 instead of 5.0 was used, the weight percentages of oxide components in the prepared REY seed were:

RE₂O₃ : 20.1, Na₂O: 1.4, Al₂O₃ : 21.9, and SiO₂: 56.6.

2.5 g REY seed prepared above was dispersed in 195g water glass containing 3.7 wt. % Na₂O and 11.7 wt. % SiO₂. 51.7 g AlPO₄ gel containing 1.5 wt. % Al₂O₃ was added to the mixture while stirring. A 23 wt. % H₃PO₄ solution was added to the system making it into gel state. The mole composition of the gel was:

0.21 RE₂O₃ 3.10 Na₂O Al₂O₃ 50.0 SiO₂ 4.08P₂O₅ 1680H₂O

40 The gel obtained was crystallized at 185 °C for 20 hours, followed by filtrating, washing, and drying. The high-silica zeolite obtained thereof had a mole composition of:

0.77Na₂O 0.14RE₂O₃ Al₂O₃ 36.3SiO₂

45 and had a SiO₂/Al₂O₃ mole ratio of 36.3.

Example 4

100 g NaY zeolite having a silica/alumina mole ratio of 5.0 was dispersed in 2100g 5.0 wt. % (NH₄)₂ SO₄ solution. The ion-exchange proceeded at boiling temperature for 30 minutes. Distilled water was added during the exchange process to maintain a constant volume. After ion-exchange and filtrating, the filter cake was calcined in flowing dry air at 550 °C for 2 hours. The calcined product was added to 5000g 1.0 wt. % RECl₃ solution. The ion-exchange proceeded at 90 °C for 30 minutes. After filtrating, the REHY seed obtained had a weight percentage composition as follows:

55 RE₂O₃ 10.0, Na₂O 0.6, Al₂O₃ 20.5, SiO₂ 68.7

3.0 g REHY seed prepared above was dispersed in 180g water glass containing 3.8 wt. % Na₂O and

11.0 wt. % SiO_2 , 42.1g AlPO_4 gel containing 0.8 wt. % Al_2O_3 was added to the mixture while stirring. A 20 wt. % HCl solution was added to adjust the PH value of the system making it into gel state. The mole composition of the gel was:

5 0.27 RE_2O_3 12.5 Na_2O Al_2O_3 100 SiO_2 0.97 P_2O_5 3655 H_2O .

The gel obtained was crystallized at 170 °C for 30 hours, followed by filtrating, washing, and drying. The high- silica zeolite obtained thereof had a mole composition as follows:

10 0.86 Na_2O 0.08 RE_2O_3 Al_2O_3 39.5 SiO_2

and had a $\text{SiO}_2/\text{Al}_2\text{O}_3$ mole ratio of 39.5.

Example 5

15 100 g NaX zeolite having a silica/alumina mole ratio of 2.9 was dispersed in 2500g 1.5 wt. % RECl_3 solution. The ion- exchange proceeded at 90 °C for 30 minutes. After filtration, the filter cake was calcined in flowing dry air at 550 °C for 2 hours. The weight percentage composition of REX seed obtained therefrom was:

20 RE_2O_3 18.5, Na_2O 6.0, Al_2O_3 27.9, SiO_2 47.6

1.0 g prepared above REX seed was dispersed in 180 g water glass containing 3.5 wt. % Na_2O and 11.1 wt. % SiO_2 . 42.5 g AlCl_3 solution containing 1.0 wt. % Al_2O_3 was added to the mixture while stirring. A
25 30 wt. % H_3PO_4 solution was used to adjust the PH value of the system making it into gel state. The mole composition of the gel was:

0.13 RE_2O_3 7.0 Na_2O Al_2O_3 80.0 SiO_2 7.2 P_2O_5 2785 H_2O .

30 The obtained gel was crystallized at 150 °C for 45 hours, followed by filtrating and washing. The high-silica zeolite obtained thereof had a mole composition as follows:

0.84 Na_2O 0.07 RE_2O_3 Al_2O_3 42.9 SiO_2

35 and had a $\text{SiO}_2/\text{Al}_2\text{O}_3$ mole ratio of 42.9.

Example 6

40 REX zeolite seed was prepared according to the method described in Example 5 except that the same exchange- calcination procedure was repeated once more after the filter cake was calcined in flowing dry air at 550 °C for 2 hours. The weight percentage composition of REX seed obtained was:

RE_2O_3 25.0, Na_2O 1.3, Al_2O_3 26.6, SiO_2 47.0.

45 2.0 g prepared REX seed was dispersed in 200g water glass containing 3.7 wt. % Na_2O and 11.7 wt. % SiO_2 . 75.8g AlPO_4 gel containing 1.5 wt. % Al_2O_3 was added to the mixture while stirring. A 5.1 wt. % H_3PO_4 solution was used to adjust the PH value of the system making it into gel state . The mole composition of the gel was :

50 0.14 RE_2O_3 2.2 Na_2O Al_2O_3 35.0 SiO_2 2.8 P_2O_5 1580 H_2O

The gel obtained was crystallized at 195 °C for 13 hours, followed by filtrating , washing, and drying. The high -silica zeolite obtained thereof had a mole composition as follows:

55 0.81 Na_2O 0.10 RE_2O_3 Al_2O_3 24.8 SiO_2

and had a $\text{SiO}_2/\text{Al}_2\text{O}_3$ mole ratio of 24.8.

Example 7

REX zeolite seed was prepared according to the method described in Example 5 except that the same exchange - calcination procedure was repeated once more after the filter cake was calcined in flowing
 5 100% steam at 550 °C for 2 hours. The weight percentage composition of REX seed obtained was:

RE₂O₃ 25.2, Na₂O 1.1, Al₂O₃ 25.1, SiO₂ 48.6.

15 g prepared REX seed was dispersed in 1130 g water glass containing 3.5 wt. % Na₂O and 11.1 wt.
 10 % SiO₂. 130g Al₂(SO₄)₃ solution containing 2.5 wt. % Al₂O₃ was added to the mixture while stirring. A 20 wt. % H₂SO₄ solution was used to adjust the pH value of the system making it into gel state. The mole composition of the gel was :

0.36 RE₂O₃ 9.7 Na₂O Al₂O₃ 65.6 SiO₂ 2380 H₂O.

15 The gel obtained was crystallized at 180 °C for 20 hours, followed by filtrating, washing, and drying. The high-silica zeolite obtained thereof had a mole composition as follows:

0.77 Na₂O 0.15 RE₂O₃ Al₂O₃ 34.5 SiO₂

20 and had a SiO₂/Al₂O₃ mole ratio of 34.5.

Examples 8-14

25 The high-silica zeolites prepared in Examples 1-7 were ion- exchanged at 90 °C for 1 hour, respectively, according to a weight ratio of zeolite : (NH₄)₂SO₄ : H₂O = 1 : 1 : 20. After filtration, the exchange- filtration procedure was repeated once more. The filter cake was then dried at 110- 120 °C, calcined at 550 °C for 2 hours. The respective H - type products were thus obtained. Their adsorption properties were listed in Table 3.

Comparative Example 1

30 5 g ZSM-5 zeolite seed was dispersed in 1 litre water glass (specific gravity 1.3) containing 40.5 g/l Na₂O and 126.0g/l SiO₂. 71.6 g 33 wt. % ethyl amine solution and 51.0g Al₂(SO₄)₃ solution containing 7.0 wt. % Al₂O₃ were added subsequently to the mixture while stirring. A dilute H₂SO₄ was used to adjust the pH value of the system making it into gel state. The mole composition of the gel was :

7.9 Na₂O Al₂O₃ 60.0SiO₂ 15.0 C₂H₅NH₂ 2500H₂O

40 The gel obtained was crystallized at 140 °C for 50 hours, followed by cooling, filtrating, washing, and drying. The anhydrous mole composition of the prepared ZSM-5 zeolite was :

1.03 Na₂O Al₂O₃ 45.8 SiO₂

45 The prepared ZSM-5 zeolite had a X - ray diffraction pattern listed in Table 2, and a SiO₂/Al₂O₃ mole ratio of 45.8.

Comparative Example 2

50 The corresponding H-ZSM-5 zeolite was prepared from ZSM- 5 zeolite of comparative Example 1 according to the method described in Examples 8-14 and a weight ratio of zeolite : (NH₄)₂ SO₄ : H₂O = 1 : 1 : 20. Its adsorption property was listed in Table 3.

Example 15 Stability Test

55 The zeolite prepared in Example 11 was ion-exchanged twice with a 5 wt. % (NH₄)₂SO₄ aqueous solution at 90 °C for 1 hour (each time) according to a weight ratio of zeolite (dry base): (NH₄)₂SO₄ = 1 : 1. The ion-exchange was followed by filtrating, washing, drying at 110- 120 °C, and calcining at 550 °C for 2 hours.

The H-type zeolite obtained thereof containing 1.9 wt. % RE_2O_3 and 0.03 wt. % Na_2O .

The washed and dried samples were treated in 100% steam at 800 °C for 1, 2, 4 and 8 hours respectively. Relative crystallinity retention of the treated samples were determined by X-ray diffraction, wherein the relative crystallinity retention was defined as the ratio of the intensity of the diffraction line at the position of $\text{CuK } 2\theta$ of the treated sample and the original sample. The results were listed in Table 4.

Table 4

Treating time (hr.)	Crystallinity retention(%)
1	90.1
2	86.0
4	85.1
8	85.0

After treated in 100% steam at 800 °C for different time length, the H-type zeolite samples were tested in a pulse reactor at 480 °C using $n\text{-C}_{14}$ alkane as feedstock to evaluate cracking activity, wherein activity = $(1 - \text{fraction of unconverted } n\text{-C}_{14}) \times 100\%$. The results were listed in Table 5.

Table 5

Treating time (hr.)	$n\text{-C}_{14}$ cracking activity(%)
0	100
1	94
2	85
4	80
8	70

Comparative Example 3

ZSM-5 zeolite was treated according to the method of Example 5 to obtain H-ZSM-5 containing 0.01 wt. % Na_2O .

The washed and dried H-ZSM- 5 samples were treated in 100% steam at 800 °C for 1, 2, 4, and 8 hours respectively. The relative crystallinity retention of the treated samples were listed in Table 6.

Table 6

Treating time (hr.)	Crystallinity retention(%)
1	94.0
2	94.2
4	94.0
8	92.8

After treated in 100% steam at 800 °C for different time length, the H-ZSM-5 samples were tested in a pulse reactor at 480 °C and atmospheric pressure using $n\text{-C}_{14}$ as feedstock to evaluate cracking activity. The results were listed in Table 7.

Table 7

Treating time (hr.)	n-C ₁₄ cracking activity(%)
0	100
1	67
2	62
4	45
8	30

The results in Tables 4-7 show that, after treated under rather severe condition, the relative crystallinity retention of the high-silica zeolite of the invention can maintain a level above 85%. As far as the figures of the crystallinity retention are concerned, the hydrothermal structure-stability of the zeolite of the invention seems slightly lower than that of H-ZSM-5. However, the hydrothermal activity-stability of the zeolite of the invention is significantly higher than that of H-ZSM-5.

Example 16 Activity for deep catalytic cracking

5.3 kg aluminium sulfate solution containing 7.0 wt.% Al_2O_3 was dispersed homogeneously in 20 kg water glass (modulus 3.2) containing 5.5 wt. % SiO_2 by stirring. A 10 wt. % ammonia water was used to adjust the PH value to 6.5 - 7.5. A silica- alumina gel containing 25 wt. % Al_2O_3 was obtained.

0.145 kg high- silica zeolite prepared according to the method described in Example 1 was ground and dispersed in the above- prepared silica-alumina gel. After homogenizing and spray- drying, the product was twice exchanged with $(\text{NH}_4)_2\text{SO}_4$ followed by washing and drying. The catalyst for deep catalytic cracking obtained contained 9 wt. % high-silica zeolite of the invention and less than 0.1 wt. % Na_2O .

The prepared catalyst was treated in 100% steam at 800 for 4 hours, and then tested in a pilot fixed-fluidized bed reactor under reaction condition: 580 °C, cat./oil ratio 5.0 and WHSV 1.0 h^{-1} . The feedstock used was a VGO having a distillation range of 197 - 479 °C and Conradson carbon 0.06 wt. %. The results of the deep catalytic cracking test were listed in Table 8.

Table 8

5	Conversion, wt. %	84.56
	Product yield, wt. %	
	Cracking gas	50.65
	H ₂	0.38
10	CH ₄	3.18

	t-C ₄ ⁼ - 2	3.45
	cis-C ₄ ⁼ - 2	2.47
25	Gasoline(C ₅ - 221°C)	26.22
	LCO(221 - 330°C)	9.78
	Heavy oil(> 330°C)	5.66
30		
	Coke	7.69
	C ₂ ⁼ + C ₃ ⁼ + C ₄ ⁼	36.85
35	Σ C ₄ ⁼	14.69

Comparative Example 4

40 The catalyst was prepared according to the method described in Example 16 except that 0. 323 kg ZSM- 5 zeolite was used for the preparation of catalyst instead of the high- silica zeolite prepared in Example 2 of the present invention. The deep catalytic cracking catalyst obtained thereof contained 18 wt. % ZSM-5 zeolite. The same reaction condition and feedstock as used in Example 16 were used herein for
 45 the deep catalytic cracking test. The results were listed in Table 9.

Table 9

5	Conversion, wt. %	84.77
	Product yield, wt. %	
	Cracking gas	48.30
	H ₂	0.37
10	CH ₄	3.10
	C ₂ H ₆	1.59
	C ₂ H ₄	3.68
	C ₃ H ₈	3.26
15	C ₃ H ₆	17.04
	i-C ₄ ⁰	3.29
	n-C ₄ ⁰	1.13
	C ₄ ⁼ -1	2.40
20	i-C ₄ ⁼	6.44
	t-C ₄ ⁼ -2	3.50
	cis-C ₄ ⁼ -2	2.50
25	Gasoline(C ₅ - 221°C)	29.04
	LCO(221 - 330°C)	9.96
	Heavy oil(> 330°C)	5.27
30		
	Coke	7.43
35	C ₂ ⁼ + C ₃ ⁼ + C ₄ ⁼	35.56
	C ₄ ⁼	14.84

The data listed in table 8 and 9 show that although the content of the high-silica zeolite of the present invention in the deep catalytic cracking catalyst is only half of the content of ZSM- 5 zeolite in the comparative catalyst, the conversion levels in both catalysts are nearly the same and the olefin yield on the former catalyst is even slightly higher.

Example 17

The silica-alumina gel containing 25 Wt. % Al₂O₃ prepared in Example 16 was also used in this example.

0.368 kg high-silica zeolite prepared according to the process described in Example 1 was ground and dispersed in the above- mentioned silica-alumina gel. After homogenizing and spray- drying, the product was ion-exchanged twice with (NH₄)₂ SO₄ followed by washing and drying. The octane- enhancement promoter for catalytic cracking obtained contained 20 wt. % high-silica zeolite of the invention and less than 0.1 wt. % Na₂O.

The promoter obtained was treated in 100% steam at 760°C for 4 hours. After treatment it was dispersed, according to a ratio of 1:99, to an industrially balanced Y-7 catalyst(REY zeolite based cracking catalyst, produced by the catalyst factory of Qilu Petrochemical Corp., SINOPEC). The well-mixed catalyst was tested in a fixed- fluidized bed reactor under reaction conditions of 500°C, cat./oil ratio 3.8, and WHSV 8.0 h⁻¹, using VGO (same as the VGO used in Example 16) as feedstock. The results were listed in Table 10.

Table 10.

	Balanced Y-7 catalyst	Balanced Y-7 catalyst mixed with the promoter of the present invention
Conversion, wt. %	62.26	68.55
Product yield, wt. %		
H ₂ - C ₂	1.63	1.44
C ₃ - C ₄	14.34	16.45
Gasoline(C ₅ - 221°C)	46.85	47.31
LCO(221 - 330°C)	18.90	18.42
Heavy oil (>330°C)	14.84	13.03
Coke	3.44	3.35
Gasoline RON(clear)	89.2	91.0
MON(clear)	78.6	80.2
Octane - barrel	4179.0	4305.2

Comparative Example 5

The octane-enhancement promoter for catalytic cracking was prepared according to the process described in Example 17 except that 0.368 kg ZSM-5 zeolite was used instead of high-silica zeolite prepared in Example 1 of the present invention. The content of ZSM-5 in the prepared promoter was 20 wt. %.

The prepared octane-enhancement promoter was treated in 100% steam at 760°C for 4 hours. The treated sample was dispersed, according to a ratio of 1:99, to an industrially balanced Y-7 catalyst. The well-mixed catalyst was tested for its activity in catalytic cracking reaction according to the process described in Example 17. The results were listed in Table 11.

Table 11.

	Balanced Y-7 catalyst	Balanced Y-7 catalyst mixed with ZSM-5 promoter
Conversion, wt. %	62.26	66.56

Product yield, wt. %		
5	H ₂ - C ₂	1.63
	C ₃ - C ₄	14.34
	Gasoline(C ₅ - 221°C)	46.85
	LCO(221 - 330°C)	18.90
	Heavy oil (>330°C)	14.84
10	Coke	3.44
	Gasoline RON(clear)	89.2
	MON(clear)	78.6
	Octane - barrel	4179.0
15		4171.9

The data listed in Table 10 and 11 show that the octane-enhancement promoter containing high-silica zeolite of the present invention has higher gasoline octane-barrel and hydrothermal activity-stability.

20 Claims

1. A synthetic crystalline aluminosilicate zeolite having an anhydrous chemical composition(based on moles of oxides) of formula:

wherein $x = 0.01 - 0.30$, $y = 0.4 - 1.0$, $z = 20 - 60$;

30 said zeolite possessing penta-sil type structure and a X - ray diffraction pattern listed in Table 1, and its normal hexane adsorption/cyclohexane adsorption ratio being 2-4 times higher than that of H-ZSM-5 zeolite.

2. A zeolite according to claim 1, wherein the composition of said zeolite is formed through the reaction of rare earth- containing faujasite seeds with the gel system comprising water glass, aluminium salt, inorganic acid and water.

3. A zeolite according to claim 1, wherein the rare earth- containing faujasite seed is REY, REHY, or REX.

4. A zeolite according to claim 3, wherein the rare earth-containing faujasite seed contains 2 - 27% rare earth elements and < 7.0% sodium(both based on the weight of oxides).

5. A process for synthesizing the crystalline aluminosilicate zeolite of claim 1, comprising dispersing rare earth- containing faujasite seed in a gel system comprising water glass, aluminium salt, inorganic acid and water, with oxide mole ratio $\text{SiO}_2/\text{Al}_2\text{O}_3 = 30 - 120$, $\text{Na}_2\text{O}/\text{Al}_2\text{O}_3 = 2 - 15$, and $\text{H}_2\text{O}/\text{SiO}_2 = 20 - 100$ and crystallizing in a still-state at 130 - 200 °C for 12 - 60 hours followed by filtrating, washing, and drying.

6. A process according to claim 5, wherein said seed is REY, REHY, or REX, containing rare earth element 2 - 27% and sodium < 7. 0% (both based on the weight of oxides).

7. A process according to claim 5, wherein the amount of the seed used should satisfy the mole ratio of RE_2O_3 (from seed) and Al_2O_3 (in said gel system) being in the range of 0.01 - 0.40.

8. A process according to claim 5, wherein said aluminium salt is $\text{Al}_2(\text{SO}_4)_3$, AlCl_3 , AlPO_4 , $\text{Al}_2(\text{HPO}_4)_3$, or $\text{Al}(\text{H}_2\text{PO}_4)_3$.

9. A process according to claim 8, wherein said aluminium salt is AlPO_4 .

10. A process according to claim 9, wherein said aluminium salt is AlPO_4 gel.

11. A process according to claim 5, wherein said inorganic acid is phosphoric acid, sulfuric acid, hydrochloric acid, or nitric acid.

5 12. A process according to claim 5, wherein the amount of said inorganic acid used should make the PH value of the system in the range of 10 - 12.

13. A process according to claim 5, wherein said still- state crystallization proceeds at 160 - 190 ° C for 16 - 30 hours.

10 14. Hydrocarbon conversion catalysts containing zeolite of claim 1.
